Lesson 1: Your Medicine. Their Drugs.

Primary care providers, when properly educated, often refer you to your doctor. But when you're like your grandma, they can be very dangerous.

Analgesics tend to be among every day more than 100 million people use daily. These drugs range from pain relievers and sleep aids to hydrocodone and the powerful OTC medicine.

7 million Americans abuse prescription drugs

Lesson 2: Your nightmare. Their drug supplier.

When you visit your doctor, you'll likely see a prescription pad. The only way to get your medicine is to go to the pharmacy. But what if you could get your medicine directly from your doctor? That's the idea behind the Direct Prescription Program. It allows doctors to prescribe certain medications directly to patients, bypassing the pharmacy. This could save time and money, but it also raises concerns about safety and quality control.

The Direct Prescription Program is a pilot program in several states. It allows doctors to prescribe certain medications directly to patients, bypassing the pharmacy. This could save time and money, but it also raises concerns about safety and quality control.
